DATA ANALYSIS

Zomato: Delhi NCR's Missing Restaurants

Which restaurants should Zomato sign up for delivery first? An analysis of 7,947 Delhi NCR listings.

Chirag P C

The question

If I ran restaurant growth for Zomato in Delhi NCR, which restaurants should my sales team sign up for delivery first? I used a public dataset of 7,947 NCR restaurants listed on Zomato to find where good restaurants are missing from delivery, and what that costs the platform.

29%
of 7,947 NCR restaurants offer online delivery

53%
of restaurants rated 4.0 or higher don't deliver (240 of 456)

~3×
more reviews for restaurants that deliver (median 77 vs. 26)

Answer in one line: The delivery catalogue is missing many of NCR's best restaurants, and it includes too many of its worst. About 70 top-rated restaurants in five localities are the highest-value targets.

Data and method

- **Source:** The Zomato Restaurants dataset on Kaggle, a public snapshot of 9,551 restaurants. I used the 7,947 in New Delhi, Gurgaon, Noida, Faridabad and Ghaziabad.
- **Fields used:** online delivery (yes/no), aggregate rating, number of votes, price range (1–4), cuisines, locality.
- **Cleaning:** 2,139 restaurants with no rating (shown as 0) are left out of all rating analysis, leaving 5,808 rated restaurants. Restaurants with several cuisines are counted once under each.
- **Tools:** Python (pandas, matplotlib). Every number in this document comes from the same script.

Finding 1: Restaurants that deliver get far more reviews

The median restaurant that delivers has **77 votes**. The median restaurant that doesn't has **26**. Delivery restaurants are also rated slightly higher: a median of 3.4 against 3.2. Votes measure engagement, not orders, but they suggest that being on delivery puts a restaurant in front of far more customers.

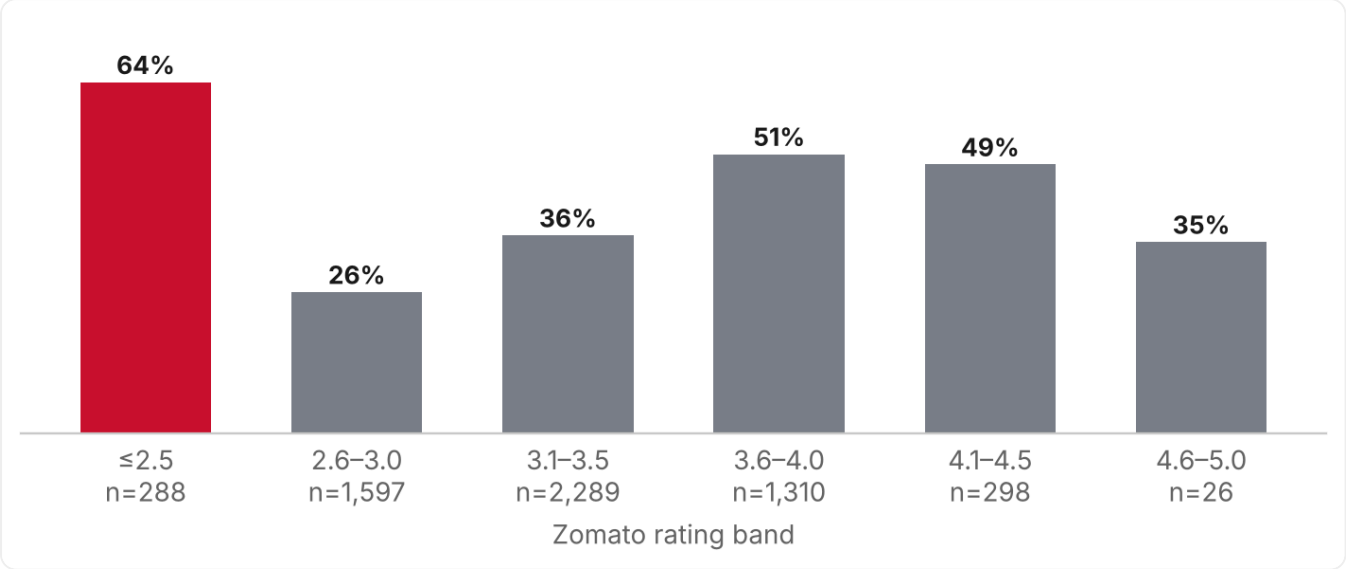

Finding 2: Half of the best restaurants aren't on delivery

Of the 456 restaurants rated 4.0 or higher, **240 (53%) don't offer delivery**. Most of these are mid-to-premium dine-in places: 162 of the 240 are in price ranges 3 and 4.

Price range	Restaurants	Share that deliver	Rated 4.0+ but not delivering
1 (budget)	4,230	16%	40
2	2,596	48%	38
3	816	44%	101
4 (premium)	305	12%	61

Delivery is concentrated in the middle price ranges. Budget places (often small and cash-run) and premium places (dine-in experiences) mostly stay offline, and that is where the top-rated gap is.

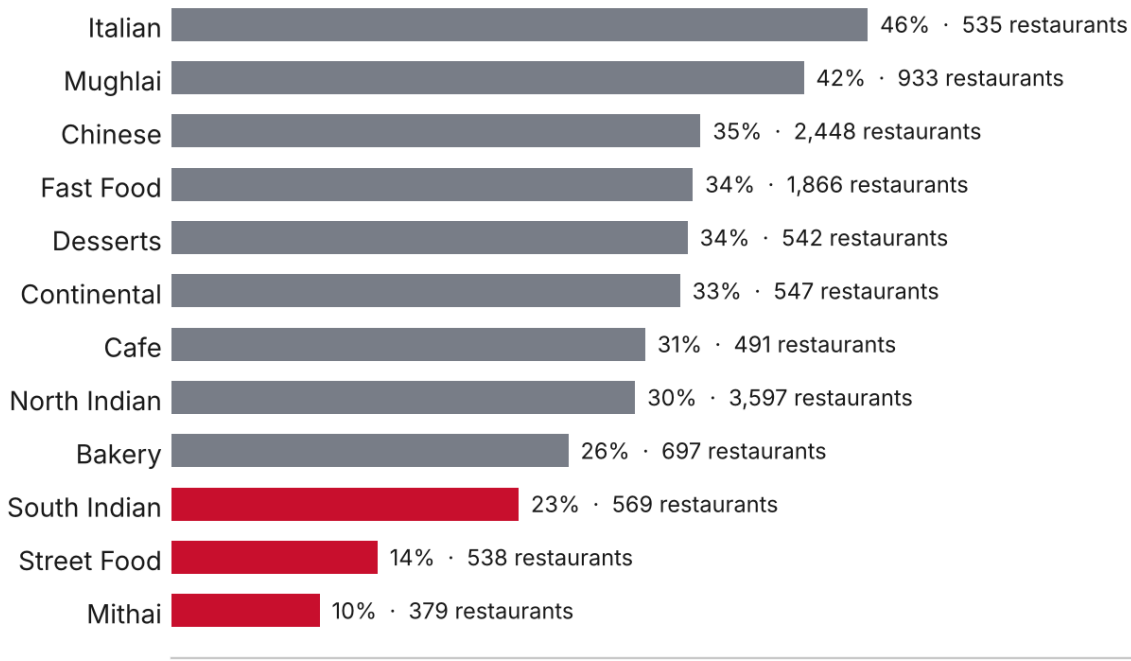

Finding 3: The worst-rated restaurants are the most likely to deliver

Share of rated NCR restaurants offering online delivery, by Zomato rating band. n = number of restaurants in each band.

Among restaurants rated 2.5 or below, **64% deliver**, which is the highest share of any band. Delivery availability then rises with quality up to about 4.0 before falling again. So a delivery customer is more likely to come across a poorly rated restaurant than someone eating out. That hurts trust in the whole delivery catalogue.

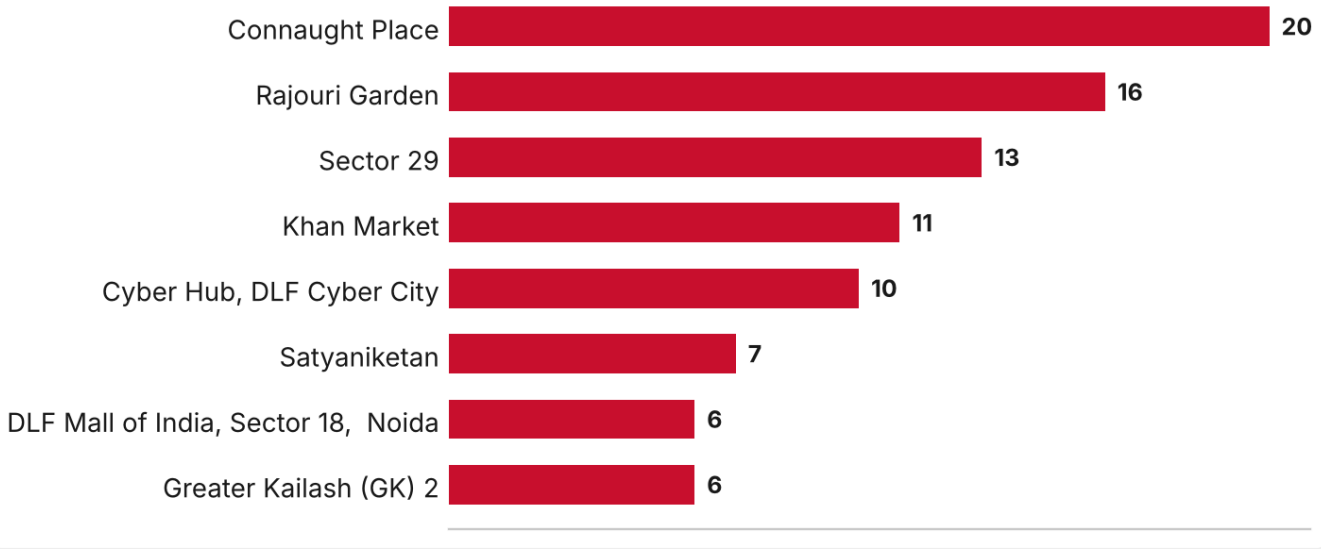

Finding 4: Some cuisines are barely on delivery

Share offering online delivery for the 12 most common cuisines in NCR. Red = the three biggest gaps.

Mithai shops (10%), street food (14%) and South Indian (23%) are well below Italian (46%) or Mughlai (42%). These are everyday, high-frequency cuisines. They likely stay offline because of packaging, freshness and very small order values, not because nobody wants them delivered.

Finding 5: The gap is concentrated in a few localities

Localities with the most restaurants rated 4.0+ that don't offer delivery.

Five localities account for **70 of the 240** gap restaurants (29%): Connaught Place, Rajouri Garden, Sector 29 in Gurgaon, Khan Market and Cyber Hub. These are dense dining areas, so one sales team can cover a lot of the gap quickly.

Recommendations

#	Action	Why	Metric
1	**Targeted sign-up drive** for the 240 restaurants rated 4.0+, starting with the 70 in the five clusters	Highest quality per sales visit; dense areas	Restaurants signed up; GOV from new restaurants rated 4.0+
2	**"Delivery-ready" kit for premium dine-in**: a trimmed delivery menu, premium packaging and a separate delivery brand if needed	Premium places worry that delivery will dilute their brand, not that there's no demand	Sign-up rate for price range 3–4; rating after the first 50 orders
3	**Pilot for everyday categories**: mithai and street food with tamper-proof packaging and orders bundled by locality	High frequency, very low delivery coverage	Orders per user per month in the pilot categories
4	**Quality floor**: rank restaurants rated 2.5 or below lower in delivery listings and offer them a quality-improvement plan	Customers trust the catalogue more when it is less cluttered with low quality	Order-weighted average rating; complaint rate

Limits of this analysis

- **An older public snapshot.** The patterns are useful, but the exact numbers will differ today. With internal data, I would repeat this on live listings and order data.
- **Votes are not orders.** Votes measure engagement. They show the direction of the effect, not its revenue size.
- **Correlation, not cause.** Restaurants that chose delivery may differ in other ways, so finding 1 doesn't prove that delivery causes more reviews.
- **Small top band.** Only 26 restaurants are rated 4.6 or higher, so the drop in that band is not reliable on its own.
