WIREFRAMES

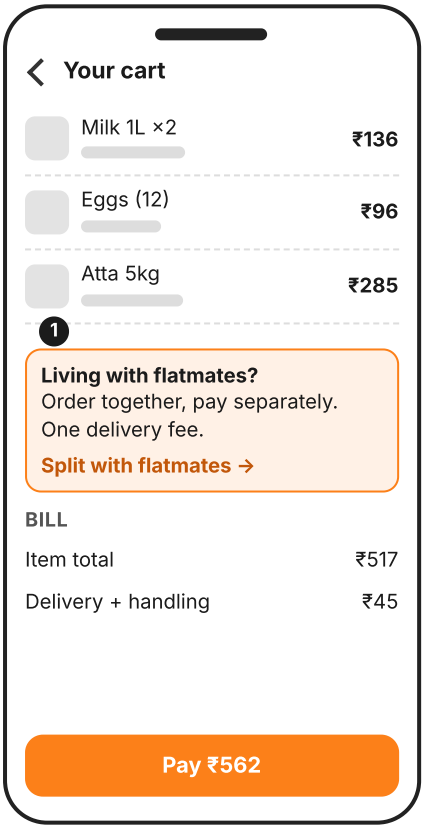

Instamart Flatmate Cart: Wireframes

Six low-fidelity screens for ordering together and paying separately.

Chirag P C

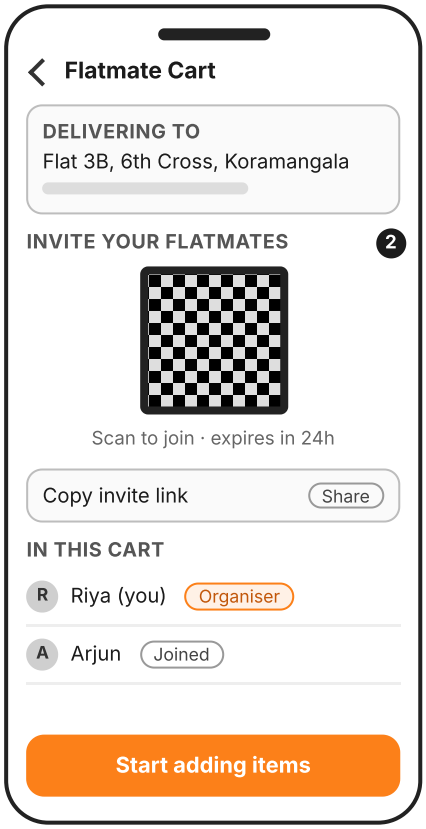

These six low-fidelity screens show the main flow from the **Instamart Flatmate Cart** PRD: starting a shared cart, adding items, splitting the bill and paying. They're kept grayscale so attention stays on layout and flow rather than visual polish. Numbered pins match the notes under each screen.

1 Entry point → 2 Invite flatmates → 3 Shared cart → 4 Review split → 5 Collect payments → 6 Order placed

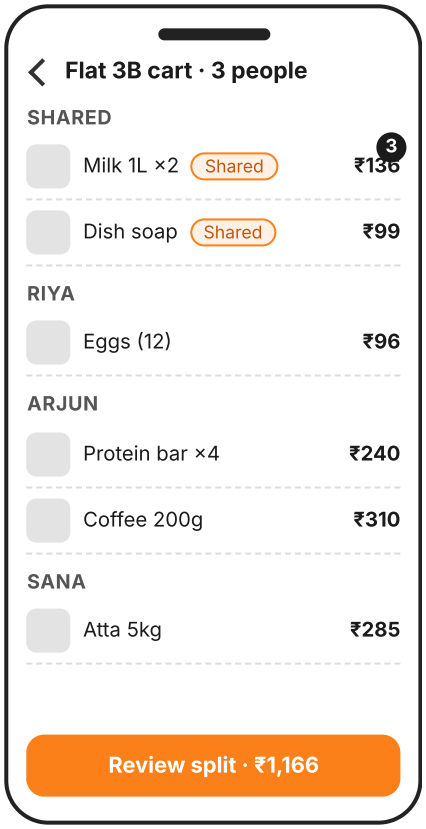

1 · Entry point in the cart

1. Shown above the bill on an address where more than one account orders, so it appears where the decision to pay is made.

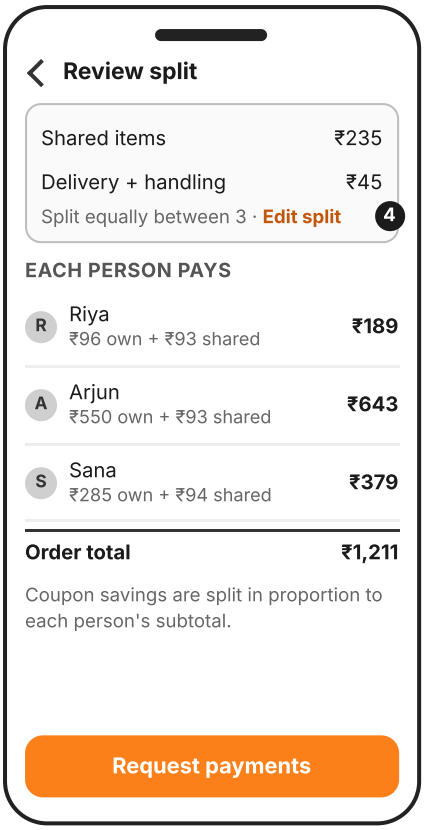

2 · Invite flatmates

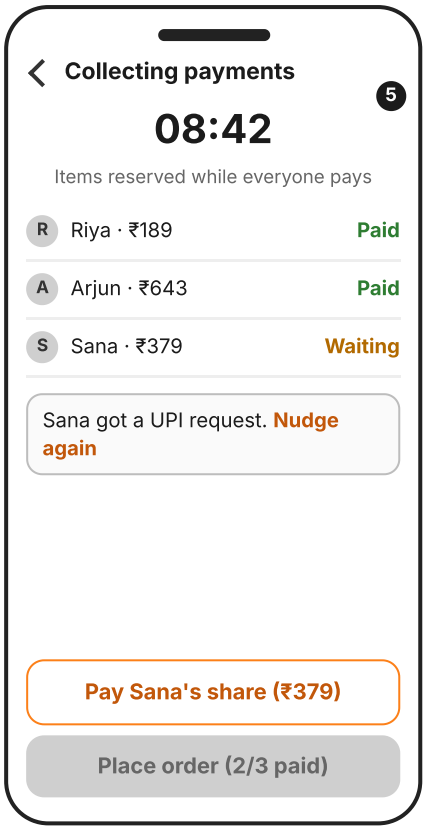

1. Tied to one address, so it's clear where the order goes.
2. QR code for people in the same room, a link for WhatsApp groups.

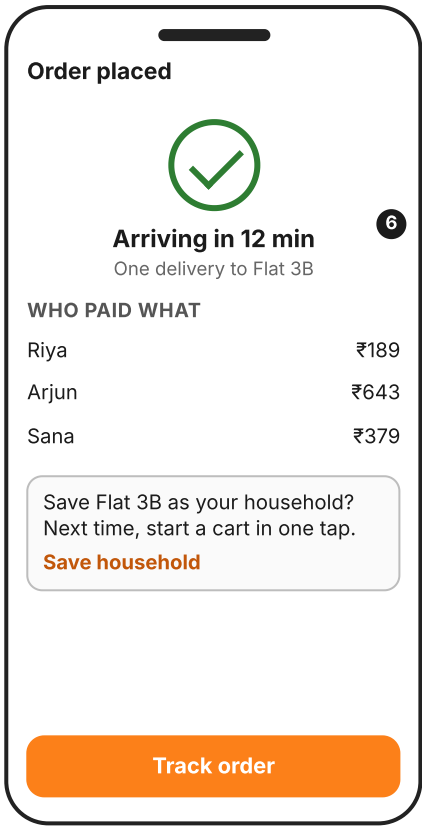

3 · Shared cart, grouped by person

1. Every item shows who added it. Long-press an item to mark it *Shared*.
2. Updates live as flatmates add items from their own phones.

4 · Review the split

1. Shared items and fees are split equally by default and can be edited.
2. Each person's line shows their own items and their share of shared items, so the split can be checked at a glance.

5 · Collect payments

1. Each person's status is shown; a 10-minute window keeps the order feeling instant.
2. The organiser can cover a share, so one slow payer never blocks the order.

6 · Order placed

1. The receipt shows each person's items and payment, so nobody needs to be paid back later.
2. "Save household" sets up the next cart, the P1 repeat-use feature from the PRD.

Design decisions

Decision	Why	Alternative considered
Entry point in the cart, not on the home screen	People decide how to pay in the cart; the home screen already has many competing banners	A home-screen tile: more visible, but users would ignore it
Group items by person	Answers "what's mine?" without scrolling the whole cart	One list with an avatar on each item: compact but hard to check
Equal split for shared items by default	Matches how most flats already split; edits are one tap away	Asking how to split every time: fairer but slower
Organiser can pay any remaining share	Protects the instant-delivery promise when someone is slow to pay	Waiting for everyone: fair, but it blocks the order

Next step: run a 5-user usability test on screens 3–5 and measure whether people can tell what they owe within 5 seconds.
